Morbidity and Mortality

Weekly
Report

PUBLIC HEALTH SERVICE

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Prepared by the

COMMUNICABLE DISEASE CENTER

MEIrose 4-5131

For release September 15, 1961

Atlanta 22, Georgia

Vol. 10, No. 36

Provisional Information on Selected Notifiable Diseases in the United States and on Deaths in Selected Cities for Week Ended September 9, 1961

Poliomyelitis - A total of 62 cases, including 37 paralytic, was reported for the week ending September 9. This represents very little change from the 60 cases, including 36 paralytic, reported during the previous week. Thus, poliomyelitis has had no substantial increase for two successive weeks. The incidence of poliomyelitis continues to remain well below previous years as shown in the following table:

Pallamyelitis Cases (Cumulative) Through 36th Week

	1961	1960	1959	1958	1957
Paralytic	454	1200	3122	1262	1305
Total	685	1735	4956	2597	4162

New York continued to account for most cases reported with 14 total and 9 paralytic cases for the current week (See Epidemiological Reports).

The only other States with more than two paralytic cases for the current week were Pennsylvania with four, and West Virginia and California with three each. There is no concentration of cases within these States.

EPIDEMIOLOGICAL REPORTS

Poliomyelitis - Upstate New York

Through Saturday, September 9, 46 cases of paralytic poliomyelitis have been reported from the Counties of

Table 1. Cases of Specified Notifiable Diseases: United States

(Cumulative totals include revised and delayed reports through previous week)

Figures for current week exclude missing report from Oklahoma

Botulism - 1 Florida

Plague 2 - N.M. (Previously described Vol. 10, No. 30, July 29 and Vol. 10, No. 35, Sept. 2)

CURRENT U. S. HEPATITIS INCIDENCE
compared with years 1954, 1959, 1960

Onondaga, Madison and Oneida in upstate New York. An additional 14 paralytic cases have been recognized through Wednesday, September 13. Of the 60 cases, 34 have occurred in Onondaga County (22 in Syracuse), 15 in Madison County, and 11 in Oneida County. Type I poliovirus has been isolated from seven of these cases. The tri-county area was the scene of an intensive immunization program from August 29-31. Over 400,000 doses of Type I oral poliovaccine were fed during this period (total population 742,000).

The 57 paralytic cases with onset of symptoms since July are shown below. Cases continue to occur in Onondaga County while the last case to occur in either Madison or Oneida County was on September 1.

Week Ending:	7/29	8/5	8/12	8/19	8/26	9/2	9/9
Onondaga County	1	2	1	4	10	11	4
Madison County	0	4	3	5	2	0	0
Oneida County	0	2	2	2	3	1	0
Total	1	8	6	11	15	12	4

Fifteen cases have been reported with onset since the oral immunization program began. All but one of the 15 cases are from Onondaga County. Of the 15 cases, 11 received oral vaccine as shown below:

Interval in Days Between Oral Vaccine and Onset of Symptoms							
No Oral Vaccine	Some Day	1	2	3	4	5	6 7
4	2	0	2	3	1	1	1

Unusual Outbreak – New York State

An unusual outbreak of disease occurred from June 8-21 in New York State. It came to light when two physicians in a small community in Chenango County saw a large number of patients with signs and symptoms of appendicitis. Six appendectomies were performed. On operation the patients were found to have mesenteric adenitis instead of appendicitis.

An attempt was made to determine the incidence of illness in the village and its environs (total population of 4,600). The local industries had no unusual absenteeism. A visit by public health nurses to the homes of children absent from the Central School (enrollment 1,521) revealed 110 cases of illness, ranging from mild, cramp-like abdominal pain to more serious illness, lasting 5 to 6 days with pain and tenderness, especially in the RLQ or LLQ of the abdomen. Twenty-four had mild diarrhea. None had blood in the stool. In the cases seen by physicians, the temperatures ranged from 99 to 103. A few cases had abdominal muscle spasm. Other symptoms were: headache, nausea, dizziness, vomiting, and stiff neck. No respiratory complaints or pain in the chest were noted. Investigation revealed no common source.

The disturbing feature of the outbreak was the difficulty in distinguishing between real appendicitis which required surgery and the epidemic disease which did not.

(continued on page 8)

Morbidity and Mortality Weekly Report

The chart shows the number of deaths reported for 117 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week, and an adjusted average for comparison. For each region the adjusted average was computed as follows: From the total deaths reported each week for the years 1956-1960, 3 central figures were selected by eliminating the highest and lowest figure reported for that week. A 5-week moving average of the arithmetic mean of the 3 central figures was then computed with adjustment to allow for population growth in each region. The average value of the regional increases was 2 percent which was incorporated in the adjusted average shown in the chart.

Table 4 shows the number of death certificates re-

ceived during the week indicated for deaths that occurred in selected cities. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week, an estimate is used.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

Table 3. DEATHS IN SELECTED CITIES BY GEOGRAPHIC DIVISIONS

(By place of occurrence and week of filing certificate. Excludes fetal deaths. Data exclude figures shown in parentheses in table 4)

Area	36th week ended Sept. 9, 1961	35th week ended Sept. 2, 1961	Adjusted average, 36th week 1956-60	Percent change, adjusted average to current week	Cumulative, first 36 weeks

() Figures shown in parenthesis are from cities which have been reporting less than five years and hence are not included in Table 3.

Morbidity and Mortality Weekly Report

Examination of stools from 6 cases and from an ileocecal lymph node yielded no virus on tissue culture or on mouse inoculation. Other laboratory findings were unrevealing.

(Reported by Daniel P. McMahon, M.D., District Health Officer, Binghamton District, New York State Department of Health).

INTERNATIONAL NOTES

Cholera - Southeast Asia

In the 4 weeks since Hong Kong was first declared a cholera infected port on August 17, there have been 124 cases of cholera there, including 14 deaths. Strict control measures and mass immunizations have been continuing in Hong Kong and in many neighboring Southeast Asian countries. No newly infected areas have been reported in Southeast Asia since August 17.

SOURCE AND NATURE OF MORBIDITY DATA

These provisional data are based on reports to the Public Health Service from the health departments of each State and Puerto Rico. They give the total number of cases of certain communicable diseases reported during the week usually ended the preceding Saturday. Total figures for the United States and the Pacific Division include data for the States of Alaska and Hawaii. Cases of anthrax, botulism, and rabies in man are not shown in table 2, but a footnote to table 1 shows the States reporting these diseases. When diseases of rare occurrence are reported by a State (cholera, dengue, plague, louse-borne relapsing fever, smallpox, louse-borne epidemic typhus, and yellow fever) this is noted below table 1.
